Portfolio Content & Evidence Report

Out Loud portfolio | 3 November 2026
Source: supplied deferred-materials checklist and newly attached voice transcript
Purpose: consolidated source-backed content, project links/image guidance, requested transcript material, and follow-up items. Wording is clarified while preserving meaning. No unsupported evidence is added.

1. Voice Introduction

Voice recording: To be supplied by the user.
Transcript: To be supplied by the user.
[Blank space reserved for voice-introduction materials.]

2. Project Links & Project Image

EquityIQ (Stock Screening Platform)
Live app: https://calm-white-cloud.lovable.app/
Project Image: landing page is public and was observed. Insert captured browser screenshot.
TrustHire (Job Verification Tool)
Live app: https://trust-hire.lovable.app/
Project Image: landing page is public and was observed. Insert captured browser screenshot.
Finance Data Processing Backend
GitHub: https://github.com/Kiyotaka-Ayanak0ji/Data_Processing_Backend
Postman API tests: https://documenter.getpostman.com/view/53009591/2sBXwqtBGr
Project Image: no deployed page supplied. Ask Emergent for a minimalist financial-data/API vector.
Secure Image Messaging
Deployment: https://steganography-project-updated-mwskcqpo9.vercel.app/
GitHub: https://github.com/Kiyotaka-Ayanak0ji/Steganography_Project_Updated
Project Image: deployment redirected to Vercel login at audit time. Use a minimal image/message vector unless public landing becomes available.
Stock Price Prediction
GitHub: https://github.com/Kiyotaka-Ayanak0ji/Stock_Price_Prediction
Project Image: no deployed page supplied. Ask Emergent for a minimal price-chart/prediction vector.
Note: Actual landing-page screenshot files were not available to embed in this report. The two public landing pages were verified in browser; insert their screenshots when available. Do not label a placeholder as a screenshot.

3. Autopsy Section ? Voice Transcript

Scope and Audience: the newly attached transcript contains no spoken Scope/Audience passage. Earlier requirements text supplies the narrative: client stock screener built as a personalized utility and consumer product; prototype followed by about 12 iterations across frontend/backend/authentication/security; motivation included AI, public-data real-time screening, stakeholder requirements, and FDE thinking. Use as written-source content, not

Voice Transcript. Voice note/transcript pending.

Plans and Pricing ? Voice Transcript

Initial idea: Free, about $20, and about $40 with unlimited use. Unlimited was later judged unsustainable due to computation/server load and product value. Final described structure: Free, Pro about $5/month, Premium about $20/month. Free demonstrated the app with Pro access initially 30 days, later about 15 days by business/client decision. Annual discounts averaged 17%. Pro included selected Pro tools/custom features. Pro and Premium offered PDF watchlist export and configurable share links; Premium included a portfolio dashboard. One lead registered and tried it; no paid subscriptions because the application remained incomplete. Lesson: price according to value, costs, effort, and user needs; avoid over/undervaluing.

3. Autopsy ? continued

Feature Gating ? Voice Transcript

Features included watchlist sharing/export, advanced filters, portfolio dashboard, automatic refresh, favorites, guided onboarding, and monthly Premium reports. Dashboard and automatic refresh were Premium+. Smart email alerts reflected habits, watchlists, and marked stocks. OAuth simplified sign-in. Competitor research informed choices. Unauthorized guest usage raised API/server-load concerns, so access restrictions and registration-gated ~15-day trials were introduced. Lesson: clarify requirements and feature behavior to avoid defects and instability.

Payments Approach ? Voice Transcript

Stripe was considered, but India availability, request/approval screening, and timing made it impractical in early development. Razorpay was selected for available payment infrastructure and currency conversion and is the only currently supported gateway described. Manual bank transfers were rejected due to security/scam risks. Juspay and PayPal/Stripe were possible alternatives, but time was limited. Subscription revenue was intended to help cover compute/infrastructure and recognize effort. Razorpay merchant verification was completed. No paid subscriptions yet because development is incomplete; source says Lovable cloud hosting inactive and app runs standalone on a Hostinger domain. Lesson: handle payment infrastructure and financial information carefully.

Launch and Traffic ? Voice Transcript

Cloudflare Analytics reportedly showed 17,000+ organic views, primarily US and other regions. The author learned that views alone do not establish sustained product use. Branding/logo, SEO/discoverability, speed, fluid UI, and iterative fixes helped. Costs include microservices, paid APIs, infrastructure, and development subscriptions, not only compute. Transcript says analytics/screenshots/docs/traffic-source files were attached, but those files were not present here; exact export/date range remain unverified.

4. Typing versus Talking ? Personalized Copy

Typing a piece of text took about 5 minutes 20 seconds; voice input took about 1 minute 30 seconds. The author is dictating this project material with Wispr Flow and then using AI to organize it for Emergent. This makes it possible to produce more material quickly; the estimated 80?90% time saving is personal experience, not a general benchmark.

Voice input helps with long documents, prompts, and substantial writing. It reduces reliance on keyboard access and typing speed. Typing still gives more precise control. Voice is useful when volume and speed matter; choice depends on task and environment.

After two to three days, the author noticed automatic corrections can change intended

wording. Reviewing a long transcript may take time. Voice input also depends on comfort with pronunciation, intonation, sentence formation, and punctuation; background noise reduces accuracy. Sensitive information such as passwords, bank details, or confidential messages may be unsuitable for dictation. Regional-language support can reduce the English-language barrier for some users. These are personal observations, not universal claims.

5. Top Three Mistakes ? Mistake / Cost / Change

Mistake 1: Neglecting cloud infrastructure and current technologies.
Cost: Cloud/scaling knowledge gaps made deployment and maintenance harder and limited translation of requirements into infrastructure decisions.
Change: Study cloud technologies, engage with difficult topics instead of avoiding them, and build comfort with deployment and scaling.
Mistake 2: Thinking only like a developer.
Cost: Limited market/business awareness contributed to interview rejections at Goldman Sachs, Amazon, and Uber; technical work was not consistently connected to real needs.
Change: Tie features to business requirements and continue the IIT Roorkee Data Science and AI program to strengthen product/business perspective.
Mistake 3: Neglecting networking and spending too much time on unproductive activities.
Cost: Procrastination and sedentary habits contributed to difficulty entering professional life, missed opportunities, criticism, and a weaker support network.
Change: Work regularly on projects, learn useful skills, attend technology events, read, follow current affairs when schedule permits, monitor relevant jobs, and attend interviews.

6. Deferred Items & Confirmation Checklist

To be supplied: voice-introduction audio and transcript; Scope and Audience voice note/transcript (absent from the newly attached transcript); separate Build Log prompt-history PDF; Submission Video Link and Challenge Post. Keep the latter sections unchanged until supplied.
Evidence mentioned but not provided here: Cloudflare analytics export with date range and traffic sources; product screenshots, pricing screenshot, feature matrix, payment documentation, launch record; any voice-receipt recordings/transcripts/flow text/build results/evidence; Bharat pitch proof, verified audio, and user-testing learnings.
Resolve the traffic discrepancy: supplied narrative says 17,000+ views; current portfolio previously showed about 10,000 views in 3?4 months. Confirm authoritative count/date range.
Approval gate: obtain explicit approval before changing Secret Layer puzzle images, mechanics, or hints. Present the proposed three-image decoder puzzle first. No puzzle change is authorized by this report.
Source limitation: attachment mentions screenshots/docs/analytics as attached, but those assets were not present with the text received for this report. No unsupported figures or evidence are asserted.
